

**In the Specification:**

**Please amend the specifications by replacing the following paragraphs:**

[0022] A potential application for the invention is in the design of a wrist hand orthosis. Like the foot, pathologies may make it difficult or painful to extend the wrist in order to raise the hand. The articulated design connects the upper section (forearm section) to the lower section (hand section) in order to provide lift assist to the hand. The range limiting feature may also be desirable for certain treatment options. The skilled in the art will see that the teachings provided herein easily and clearly extend to a wrist hand orthosis.
